

# ARC PRODUCT FAMILY

## Obtain Full Value of Data

ARC is the only data security technology that is application independent, database independent, inherently SOX friendly, instantly configurable and ensures free data availability for the corporate decision makers for whom the huge IT investments were made in the first place. Access control, data source aggregation and audit logging are prerequisites to any business data sharing and are usually met by integrating three or more diverse technologies. ARC products provide **all the three functionalities in one** incurring following benefits to the end customer :-

- No integration problems.
- Cost effective.
- Inherently SOX/HIPAA friendly.
- Secure connection to enterprise database for MS Office/Spread sheet users.
- Fast and risk free implementation complementing any of the existing systems.

Conventional solutions prescribed by various vendors come as a bundle of multiple technologies woven in complex fabric where you find access control logic some times tied to database, embedded in crystal reports, within web front ends and often in various middle tiers in addition to enterprise application's native access control. Diversity of data sources, multiplicity of data consumers and escalated number of users exponentially increase the cost, complexity creating a maintenance nightmare due to access control duplicated and distributed at various place. SOX/HIPAA compliance requirements have added a new dimension to the already complex situation.

The current approach of embedding access control logic at different places meeting local needs itself is a wrong approach in the first place.

We introduce ARC as the innovative technology that drastically simplifies the secure data sharing with following advantages over conventional solutions.

- Easy implementation of real life access policies without programming.
- Policies defined once enforceable in all the applications including **MS Excel**.
- Extend the policies to the users and operands beyond one data source.
- Trace, detect and prevent suspicious data access.

ARC is a **must-have** technology for you if you are

- 1) Implementing BI or reporting applications.
- 2) Implementing SOX or HIPAA compliance.
- 3) Sharing the enterprise data in a web application.
- 4) Implementing B2B exchange with your vendors, customers or partners.
- 5) Outsourcing some business process.
- 6) Owning legacy application software that needs to be secured without touching the old code.

**Shield your database with a SQL firewall**

**Know who is accessing what data**

**Design and publish reports safely on the web**

**Secure and manage diverse data exchanges**

**Implement cost effective virtual data warehouse**

**Access your DB2 data with diverse consumers**
